

## Milestone 4

### Team Name:

Software Team Awesome

### Team Members:

-Kyle Gorges  
-Imran Dawud  
-Andrew Gelfman  
-Abby Johnson  
-Yuxiang Wang  
-Dongyu Wu

### Database Software, and Database Creation Script

- Select your DBMS software. Create your database and populate it with ample data necessary to conduct initial program testing. Creating and populating the database should be done using sql scripts. The scripts should be included in your github repository.
  - We are using MySQL. It is a good tool to build a database quickly and easily and help us to find data from tables that we need for our website. We have populated the database with sample username/password information and a few sample appointments to show how the information would be stored in our project. We did not use scripts to create the database but rather we used MySQL workbench.

### Data Model

- Create a document that visually depicts the contents and structure of your database. For example, an entity relationship diagram showing all database tables, attributes, primary keys, foreign keys and relationships between tables. Your design should include at least 2 tables.
